

Consumer price index (CPI) August 2012

Monthly inflation in August increased +0.4%, while the annual inflation was +4.0%

Monthly inflation measured by Consumer price index increased +0.4% in August. This was influenced mostly by the increase in prices of electricity; fuels and lubricants for personal transport equipment, catering services and personal care.

When observing the main groups, monthly growth of prices was noticed in the following groups: Housing, water, electricity, gas and other fuels (+3.2%); Transport (+2.2%); Restaurants and hotels (+0.5%); Miscellaneous goods and services (+0.2%), while a decrease in prices is recorded in groups: Clothing and footwear (-1.0%); Food and non-alcoholic beverages (-0.5%); Furnishing, household equipment and routine household maintenance (-0.1%); Health (-0.1%); Recreation and culture (-0.1%). Prices in the groups: Alcoholic beverages and tobacco, Communications and Education, remain at the same level as in the previous month.

Positive annual inflation rates in August were observed in the following groups: Alcoholic beverages and tobacco (+11.1%); Hotels and restaurants (+11.0%); Housing, water, electricity, gas and other fuels (+10.6%); Communications (+4.0%); Recreation and culture (+3.8%); Food and non-alcoholic beverages (+3.2%); Transport (+2.3%); Health (+1.1%); Miscellaneous goods and services (+0.1%); while negative annual inflation rates were observed in the following groups: Clothing and footwear (-0.3%); Furnishing, household equipment and routine household maintenance (-0.2%).

METHODOLOGICAL NOTES

Consumer price indices (CPI) are the most important short-term indicators and the basis for taking decisions in the area of economy and finance. Since January 2009 they are used as *official measure of inflation* in Montenegro.

Consumer price index is used for harmonising wages and salaries in accordance with collective contracts, pensions, and social benefits. Also, it is used for deflating certain macroeconomic aggregates in national accounts statistics and for other purposes.

Consumer price index is defined as measure of average price change of fixed good and service basket bought by household for the purposes of satisfying its needs.

Weights used for calculating the consumer price index express a relative importance of selected products and services in total household consumption at the domestic territory.

Product list is regularly revised so that its representative status related to consumption structure and consumer habits is preserved.

The data are published on 15th in a month for the previous month, as well as via our website www.monstat.org

The influence of certain groups on inflation rate indicates how much that group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%, this will influence for approx. 0.5% ($10 \times 5\% = 0.5\%$ - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% ($12 \times 0.5\% = 0.06\%$ - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.
