Consumer price index (CPI) *April 2015*

Monthly inflation in April was 0.3%

Monthly inflation measured by Consumer price index was 0.3% in April 2015, while the annual inflation was 2.1%, up from 1.6% in March. This was influenced mostly by the increase in prices of: fruit; fuels and lubricants; tobacco; water supply etc. Consumer prices in period January-April 2015 compared to the same period of the previous year were higher for 1.1%.

When observing the main groups monthly growth of prices was noticed in the following groups: Alcoholic beverages and tobacco (2.5%); Transport (1.1%); Housing, water, electricity, gas and other fuels (0.8%), while a drop of prices was recorded in group: Clothing and footwear (-0.5%); Furnishing, household equipment and routine household maintenance (-0.2%); Communications (-0.1%); Recreation and culture (-0.1%). Prices of other products and services mostly remained unchanged.

Positive annual inflation rates in April were observed in the following groups: Food and non-alcoholic beverages (4.1%); Alcoholic beverages and tobacco (3.7%); Clothing and footwear (3.5%); Housing, water, electricity, gas and other fuels (2.7%); Health (2.7%); Recreation and culture (2.6%); Miscellaneous goods and services (1.1%), while negative annual inflation rates were observed in the following groups: Transport (-4.4%); Furnishing, household equipment and routine household maintenance (-0.7%); Restaurants and hotels (-0.6%).

0722	Fuels and lubricants for personal transport equipment	51.0	-11.1	-0.57

METHODOLOGICAL NOTES

Consumer price indices (CPI) are the most important short-term indicators and the basis for taking decisions in the area of economy and finance. Since January 2009 they are used as *official measure of inflation* in Montenegro.

Consumer price index is used for harmonising wages and salaries in accordance with collective contracts, pensions, and social benefits. Also, it is used for deflating certain macroeconomic aggregates in national accounts statistics and for other purposes.

Consumer price index is defined as measure of average price change of fixed good and service basket bought by household for the purposes of satisfying its needs.

Weights used for calculating the consumer price index express a relative importance of selected products and services in total household consumption at the domestic territory.

Product list is regularly revised so that its representative status related to consumption structure and consumer habits is preserved.

Data are published according Data publishing calendar as on our website www.monstat.org

The influence of certain groups on inflation rate indicates how much that group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%. this will influence for approx. 0.5% ($10 \times 5\% = 0.5\%$ - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% ($12 \times 0.5\% = 0.06\%$ - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.
