

Consumer price index (CPI) September 2017

Monthly inflation in September 2017 was 0.9%

Monthly inflation measured by Consumer price index was 0.9% in September 2017, while the annual inflation was 2.8%. This was influenced mostly by increase in prices of: shoes and other footwear; garments; vegetables; fuels and lubricants for personal transport equipment; solid fuels, etc. Growth rate of consumer prices in period January-September 2017 compared with the same period of previous year was 2.4%.

Observing the main groups monthly growth of prices was noticed in the following groups: Clothing and footwear (10.6%); Transport (0.7%); Housing, water, electricity, gas and other fuels (0.4%); Alcoholic beverages and tobacco (0.1%), while a drop of prices was recorded in the following groups: Restaurants and hotels (-3.6%); Furnishing, household equipment and routine household maintenance (-0.1%).

Prices of other products and services mostly remained unchanged.

Positive annual inflation rates in September 2017 were observed in the following groups: Alcoholic beverages and tobacco (15.0%); Transport (7.2%); Clothing and footwear (5.8%); Restaurants and hotels (4.1%); Health (2.5%); Miscellaneous goods and service (2.1%); Housing, water, electricity, gas and other fuels (2.0%); Food and non-alcoholic beverages (1.0%); Communication (0.1%), while negative annual inflation rates were observed in the following groups: Recreation and culture (-0.7%) and Furnishing, household equipment and routine household maintenance (-0.3%).

0561	Non-durable household goods	15.2	-1.8	-0.03
0122	Mineral waters, soft drinks, fruit and vegetable juices	11.7	-2.8	-0.03

METODOLOGICAL NOTES

Consumer price indices (CPI) are one of the most important macroeconomic indicators and the basis for taking decisions in the area of economy and finance. Since January 2009 they are used as *official measure of inflation* in Montenegro.

Consumer price index is used for harmonising wages and salaries in accordance with collective contracts, pensions, and social benefits. Also, it is used for deflating certain macroeconomic aggregates in national accounts statistics and for other purposes.

Consumer price index is defined as measure of average price change of fixed good and service basket bought by household for the purposes of satisfying its needs.

Weights used for calculating the consumer price index express a relative importance of selected products and services in total household consumption at the domestic territory.

Product list is regularly revised so that its representative status related to consumption structure and consumer habits is preserved.

Data are published according [Data publishing calendar](#).

The influence of certain groups on inflation rate indicates how much that group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%. this will influence for approx. 0.5% ($10 \times 5\% = 0.5\%$ - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% ($12 \times 0.5\% = 0.06\%$ - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.
