

## Consumer price index (CPI) October 2014

### Monthly inflation in October was +0,1%

Monthly inflation measured by Consumer price index was +0.1% in October, while the annual inflation was -0.5%, up from -0.7% in September. This was influenced mostly by the increase in prices of: shoes and other footwear; garments; solid fuels and fish.

When observing the main groups monthly growth of prices was noticed in the following groups: Clothing and footwear (+3.6%); Housing, water, electricity, gas and other fuels (+0.6%); Health (+0.2%); Communications (+0.1%); Miscellaneous goods and services (+0.1%), while a drop of prices was recorded in groups: Transport (-1.8%); Restaurants and hotels (-1.8%); Furnishing, household equipment and routine household maintenance (-0.4%); Food and non-alcoholic beverages (-0.1%). Prices in groups: Alcoholic beverages and tobacco; Recreation and culture; Education remained at the same level as in the previous month.

Positive annual inflation rates in October were observed in the following groups: Health (+2.3%); Alcoholic beverages and tobacco (+0.7%); Clothing and footwear (+0.6%), while negative annual inflation rates were observed in the following groups: Communications (-3.7%); Furnishing, household equipment and routine household maintenance (-2.1%); Transport (-1.7%); Miscellaneous goods and services (-1.5%); Restaurants and hotels (-0.6%); Food and non-alcoholic beverages (-0.2%); Recreation and culture (-0.2%); Housing, water, electricity, gas and other fuels (-0.1%).

0722	Fuels and lubricants for personal transport equipment	51.0	-5.1	-0.26
0115	Oils and fats	16.3	-17.9	-0.29

## METHODOLOGICAL NOTES

**Consumer price indices** (CPI) are the most important short-term indicators and the basis for taking decisions in the area of economy and finance. Since January 2009 they are used as *official measure of inflation* in Montenegro.

Consumer price index is used for harmonising wages and salaries in accordance with collective contracts, pensions, and social benefits. Also, it is used for deflating certain macroeconomic aggregates in national accounts statistics and for other purposes.

*Consumer price index* is defined as measure of average price change of fixed good and service basket bought by household for the purposes of satisfying its needs.

*Weights* used for calculating the consumer price index express a relative importance of selected products and services in total household consumption at the domestic territory.

Product list is regularly revised so that its representative status related to consumption structure and consumer habits is preserved.

The data are published on 15<sup>th</sup> in a month for the previous month on our website [www.monstat.org](http://www.monstat.org)

**The influence of certain groups on inflation rate** indicates how much that group has influenced on the total inflation rate. The influence depends on weights and inflation rate of given group. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%. this will influence for approx. 0.5% ( $10 \times 5\% = 0.5\%$  - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06% ( $12 \times 0.5\% = 0.06\%$  - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation.
