Harmonised Index of Consumer Prices (HICP) December 2015

Average annual inflation in December 2015 measured by HICP was 1,4%

Consumer prices in Montenegro, measured by HICP, in December 2015 decreased by 0,3% at the average as compared to November 2015. Consumer prices in December 2015 increased by 1,7%, as compared to December 2014. Growth rate of consumer prices in period January-December 2015 compared with the same period of previous year was 1.4%.

Observing the main groups, monthly drop of prices was noticed in the following groups: Transport (-1.8%); Food and non-alcoholic beverages (-0.3%); Clothing and footwear (-0.3%); Restaurants and hotels (-0.2%); Recreation and culture (-0.1%), while a monthly growth of prices was recorded in groups: Alcoholic beverages and tobacco (0.1%); Housing, water, electricity, gas and other fuels (0.1%). Prices of other products and services mostly remained unchanged.

Positive annual inflation rates in December were observed in the following groups: Clothing and footwear (4.9%); Restaurants and Hotels (4.2%); Alcoholic beverages and tobacco (3.4%); Food and non-alcoholic beverages (2.4%); Health (1.5%); Housing, water, electricity, gas and other fuels (1.4%); Recreation and culture (1.4%); Furnishing, household equipment and routine household maintenance (1.2%); Miscellaneous goods and services (0.4%); Communications (0.1%), while negative annual inflation rate was observed in group Transport (-4.4%).

Chart 3. Annual inflation rate measured by HICP, December 2015

Euro area annual inflation was 0.2% in December 2015, up from 0.1% in November. **European Union** annual inflation was 0.2% in December 2015, up from 0.1% in November.

Harmonised Index of Consumer Prices (HICP) is the basis for comparative measurement of inflation in the European Union, and it estimates a monetary value in the Eurozone. As a difference to Consumer Index Index Price (CPI), it uses different methodological concept which is used by all EU members.

Dec 2015 month of the current year
Ø 2010 average of base year

This rate indicates a change in average prices in current month when compared with average prices in the base year.

Dec 2015 month of the current year
Nov 2015 previous month of the current year

Monthly inflation rate (current month compared with previous month) measures a change of average prices of current months compared with average prices of previous month. Monthly inflation rate can be under the influence of seasonal effects.

Dec 2015 month of the current year
Dec 2014 the same month of previous year

Annual inflation rate (month of the current year compared with the same month of previous year) measures a change in average prices in current month compared with average prices in the same month of previous year. In the presence of a stable seasonal pattern, seasonal effects do not influence this measure.

Dec 2015 month of the current year
Dec 2014 December of the previous year

This rate indicates a change in average prices in current month compared with average prices in December of the previous year. In December this rate equal the annual inflation rate.

The influence of certain subgroups on inflation rate indicates how much that subgroup has influenced on the total inflation rate. The influence depends on weights and inflation rate of given subgroup. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%, this will influence for approx. 0.5 percentage points ($10 \times 5\% = 0.5$ percentage points - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06 percentage points ($12 \times 0.5\% = 0.06$ percentage points - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation. Summing up the influence in percentage points of all subgroups the final result should equal the all-items index rate of change in percentage.
