

Harmonised Index of Consumer Prices (HICP) June 2015

Monthly inflation in June was 1.2%

Monthly inflation measured by Harmonised Index of Consumer Prices was 1.2% in June 2015, while the annual inflation was 2.0%, up from 1.6% in May. This was influenced mostly by increase in prices of: accommodation services; restaurants, cafés and the like; fruit; fuels and lubricants for personal transport; furniture and furnishings. Consumer prices measured by the HICP in period January-June 2015 compared to the same period of the previous year were higher for 0.9%.

Observing the main groups, monthly growth of prices was noticed in the following groups: Restaurants and hotels (8.4%); Furnishing, household equipment and routine household maintenance (0.8%); Transport (0.4%); Recreation and culture (0.4%); Alcoholic beverages and tobacco (0.1%), while a monthly drop of prices was recorded in groups: Clothing and footwear (-0.6%); Food and non-alcoholic beverages (-0.5%); Communications (-0.1%).

Positive annual inflation rates in June were observed in the following groups: Restaurants and Hotels (5.1%); Alcoholic beverages and tobacco (3.5%); Health (2.6%); Clothing and footwear (2.5%); Food and non-alcoholic beverages (2.4%); Recreation and culture (2.4%); Housing, water, electricity, gas and other fuels (2.0%); Furnishing, household equipment and routine household maintenance (0.7%); Miscellaneous goods and services (0.2%), while negative annual inflation rate was observed in the group Transport (-1.6%).

Chart 3. Annual inflation rate measured by HICP, June 2015

Euro area annual inflation was 0.2% in June 2015, down from 0.3% in May while European Union annual inflation was 0.1% in June 2015, down from 0.3% in May.

Harmonised Index of Consumer Prices (HICP) is the basis for comparative measurement of inflation in the European Union, and it estimates a monetary value in the Eurozone. As a difference to Consumer Index Index Price (CPI), it uses different methodological concept which is used by all EU members.

Jun 2015 month of the current year
Ø 2010 average of base year

This rate indicates a change in average prices in current month when compared with average prices in the base year.

Jun 2015 month of the current year
May 2015 previous month of the current year

Monthly inflation rate (current month compared with previous month) measures a change of average prices of current months compared with average prices of previous month. Monthly inflation rate can be under the influence of seasonal effects.

Jun 2015 month of the current year
Jun 2014 the same month of previous year

Annual inflation rate (month of the current year compared with the same month of previous year) measures a change in average prices in current month compared with average prices in the same month of previous year. In the presence of a stable seasonal pattern, seasonal effects do not influence this measure.

Jun 2015 month of the current year
Dec 2014 December of the previous year

This rate indicates a change in average prices in current month compared with average prices in December of the previous year. In December this rate equal the annual inflation rate.

The influence of certain subgroups on inflation rate indicates how much that subgroup has influenced on the total inflation rate. The influence depends on weights and inflation rate of given subgroup. The weights represents a relative share of household consumption of certain groups or subgroup of products in the total consumption. Consequently, weights have an important role in the calculation of inflation rate. They represent "importance" of certain product group in the total household consumption in certain reference period. For example, if during certain month prices of bread increases for 10%, this will influence for approx. 0.5 percentage points ($10 \times 5\% = 0.5$ percentage points - since the share of bread in the total expenses is 5%). But, if the prices of medicaments increase 12%, this will increase the inflation for 0.06 percentage points ($12 \times 0.5\% = 0.06$ percentage points - since the share of medicaments in the total expenses 0.5%). This simple example indicates how much large influence have weights on the final number presenting the inflation. Summing up the influence in percentage points of all subgroups the final result should equal the all-items index rate of change in percentage.
